

Revision Notes

CHEMISTRY

Organic Chemistry

Organic Chemistry

It is the chemistry of specific carbon compounds except oxides, carbonates and carbides.

Hydrocarbons

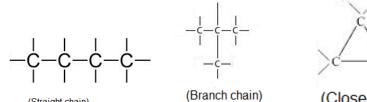

Organic compounds composed of carbon and hydrogen only. Examples: Methane (CH_4) , ethane (C_2H_6)

Unique Nature of Carbon Tetravalency of Carbon

- Carbon forms four covalent bonds by mutually sharing its four electrons with other atoms. •
- It is hence tetravalent or exhibits tetravalency. •

Catenation

- It is the tendency of an element to form chains of identical atoms. •
- Catenation is maximum in carbon because the value of the C–C bond energy is maximum. •
- Carbon undergoes self-linking forming straight, branched and closed chains. •

(Straight chain)

(Closed chain)

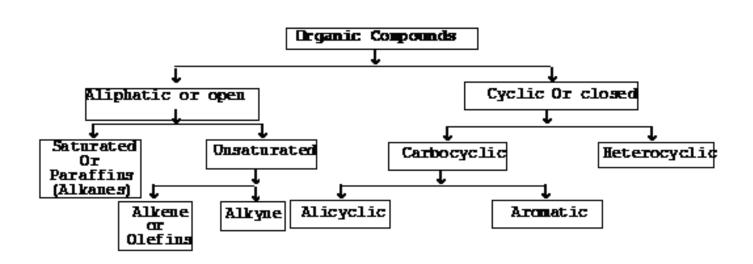

Catenation and tetravalency also result in the formation of single, double and triple bonds.

(Single bond)

(Double bond)

(Triple bond)

Classification of Organic Compounds

Homologous Series

It is a group of organic compounds with a similar structure and similar chemical properties in which the successive compounds differ by a CH_2 group.

Characteristics of a homologous series

- i. Each member of the series differs from the preceding one by the addition of a CH₂ group and by 14 amu.
- ii. All members of a homologous series share a general formula.
 For example, the general formula for alkane is C_nH_{2n+2} and that for alkene is C_nH_{2n}.
- iii. The physical properties of the members show gradation in properties as molecular mass increases.
- iv. The chemical properties also show gradient similarity.
 - For example, methane and ethane react with chlorine to form methyl chloride and ethyl chloride, respectively.

 $CH_4 + CI_2 \rightarrow CH_3CI$ $C_2H_6 + CI_2 \rightarrow C_2H_5CI$

v. All members of a homologous series can be prepared by the same general method of preparation. For example, alcohols can be prepared from alkyl halides.

CH₃Br + KOH $\xrightarrow{\text{Boil}}$ CH₃OH + KBr C₂H₅Br + KOH $\xrightarrow{\text{Boil}}$ C₂H₅OH + KBr

Significance of a Homologous Series

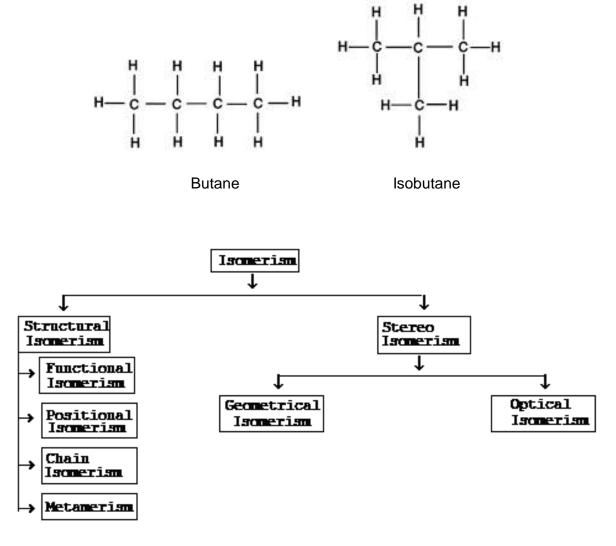

- i. Helps in the systematic study of organic compounds.
- ii. Predicts the properties and the nature of other elements of the series if the same is known of the first few members.

CHEMISTRY ORGANIC CHEMISTRY

Isomers

Compounds with the same molecular formula but different structural formula are known as isomers, and the phenomenon is known as isomerism.

Examples: Butane and isobutane are two different compounds with the same molecular formula C₄H₁₀.

Causes of Isomerism

- i. Difference in the mode of linking of atoms.
- ii. Difference in the arrangement of atoms or groups in space.

Different Types of Structural Isomerism

i. Chain isomerism

Two or more compounds which have a similar molecular formula but different arrangement of carbon atoms in straight or branched chains are referred to as chain isomers, and the phenomenon is known as chain isomerism.

ii. Position isomerism

When two or more compounds with the same molecular formula differ in the position of the substituent atom or functional group on the carbon atom, they are called position isomers, and the phenomenon is known as position isomerism.

iii. Functional isomerism

Two or more compounds with the same molecular formula but different functional groups are called functional isomers, and the phenomenon is known as functional isomerism.

iv. Metamerism

It arises because of unequal distribution of alkyl groups on either side of the functional groups in the molecules.

Nomenclature

It is the system of assigning names to organic compounds.

The Systems of Nomenclature Are

- i. Trivial system
- ii. IUPAC (International Union of Pure and Applied Chemistry) system

According to the IUPAC system, the name of an organic compound consists of three parts:

- i. Root word
- ii. Suffix
- iii. Prefix

i. Root word

It depends on the number of carbon atoms present in the longest carbon chain selected.

Number of carbon atoms		Root word
One carbon atom	C ₁	Meth
Two carbon atoms	C ₂	Eth
Three carbon atoms	C ₃	Prop
Four carbon atoms	C_4	But
Five carbon atoms	C_5	Pent
Six carbon atoms	C_6	Hex
Seven carbon atoms	C ₇	Hept
Eight carbon atoms	C ₈	Oct
Nine carbon atoms	C ₉	Non
Ten carbon atoms	C ₁₀	Dec

ii. Suffix

The root word is followed by an appropriate suffix, which represents the nature of the bond in a carbon–carbon atom.

Nature of bond	Suffix	General name	General formula
Single bond (C–C)	-ane	Alkane	C_nH_{2n+2}
Double bond (C=C)	-ene	Alkene	C_nH_{2n}
Triple bond ($C \equiv C$)	-yne	Alkyne	C_nH_{2n-2}
Group (R-)	-yl	Alkyl	C_nH_{2n+1}

iii. Prefix

It denotes the substituent, alkyl or functional group and its position in the carbon chain. Di-, tri- and tetra- are used for two, three and four groups of the same type, respectively.

Functional Group

It is an atom or a group of atoms which defines the structure (or the properties of a particular family) of organic compounds.

Characteristics of a Functional Group

- i. Compounds of the same functional group are identified using the same types of tests.
- ii. The physical and chemical properties of the compounds of different functional groups are different.
- iii. There exists a homologous series of compounds containing a particular type of functional group.

Functional	General	Organic	Suffix	Examples with common and IUPAC
		•	Sum	
group	formulae	compound		name
Halide	R–X	Haloalkanes	ane	CH₃CI
-X				Common name: Methyl chloride
(F, Cl, Br, I)				IUPAC name: Chloromethane
Hydroxyl	R–OH	Alcohols	ol	C ₂ H ₅ OH
–OH				Common name: Ethyl alcohol
				IUPAC name: Ethanol
Aldehyde	H > C=0	Aldehydes	al	CH₃CHO
-CHO	R	-		Common name: Acetaldehyde
				IUPAC name: Ethanal
Carboxyl	.0	Carboxylic	oic	CH ₃ CH ₂ COOH
-COOH	R - C-O-H	acids	acid	Common name: Propionic acid
	R - C-O-H			IUPAC name: Propanoic acid
.	0	Ketones	one	CH ₃ COC ₂ H ₅
U	U			Common name: Diethyl ketone
Keto - C -	R - C - R			IUPAC name: Pentanone
Ethers	R–O–R'	Ethers	оху	$CH_{3}-O-C_{2}H_{5}$
			,	Common name: Ethyl methyl ether
<u> </u>				IUPAC name: Methoxy ethane

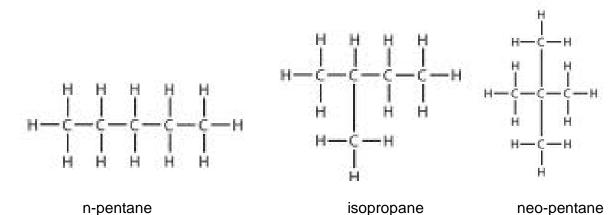

Alkanes

- Alkanes are hydrocarbons in which all the linkages between the carbon atoms are single covalent bonds.
- Compounds are known as saturated hydrocarbons because all the four valencies of carbon are fully satisfied.
- General formula : C_nH_{2n+2}
- These hydrocarbons are relatively unreactive under ordinary conditions so they are also called paraffins.

Isomerism in Alkanes

- Alkanes with more than three carbon atoms form isomers.
- The various isomers differ in the framework of the carbon chains. Example:

Isomers of Pentane (C₅H₁₂)

Laboratory Preparation of Methane and Ethane

CH₃COONa + NaOH $\xrightarrow[300^{\circ}C]{300^{\circ}C}$ Na₂CO₃ + CH₄ C₂H₅COONa + NaOH $\xrightarrow[300^{\circ}C]{300^{\circ}C}$ Na₂CO₃ + C₂H₆

Methods of Preparation of Methane and Ethane

- 1. From iodomethane or bromoethane: $\begin{array}{rrr} CH_3I+2[H]\rightarrow CH_4 &+ &HI\\ C_2H_5I+2[H]\rightarrow C_2H_6+HI \end{array}$
- 2. Methane is produced on addition of water to aluminium carbide at room temperature. Al₄C₃ + 12H₂O \rightarrow 3CH₄ + 4Al (OH)₃

3. Ethane from alkyl halides:

 $2CH_3I + 2Na \xrightarrow{dry ether} CH_3 - CH_3 + 2NaI$ This reaction is known as the Wurtz reaction.

Chemical Properties

1. Substitution reaction (i) Reaction with halogens $CH_4 + Cl_2$ \longrightarrow $CH_3Cl + HCl$ $CH_3Cl + Cl_2 \rightarrow CH_2Cl_2 + HCl$ $CH_2Cl_2 + Cl_2 \rightarrow CHCl_3 + HCl$ $CHCl_3 + Cl_2 \rightarrow CCl_4 + HCl$ (Carbon tetrachloride) (ii) Reaction with oxygen $CH_4 + 2O_2 \rightarrow CO_2 + 2H_2O$ $2C_2H_6 + 7O_2 \rightarrow 4CO_2 + 6H_2O$

Insufficient supply of air

 $2CH_4 + 3O_2 \rightarrow 2CO + 4H_2O$ $2C_2H_6 + 5O_2 \rightarrow 4CO + 6H_2O$

2. Cracking or Pyrolysis

 $2CH_{4} \xrightarrow{1500^{\circ}C} CH \equiv CH + 3H_{2}$ $CH_{3}-CH_{3} \xrightarrow{500^{\circ}C} CH_{2}=CH_{2} + H_{2}$

3. Catalytic oxidation of alkanes

 $2CH_{4} + O_{2} \xrightarrow{475K Cu tube} 2CH_{3}OH$ 475K Cu tube $2C_{2}H_{6} + O_{2} \xrightarrow{120atm.} 2C_{2}H_{5}OH$ $CH_{4} + O_{2} \xrightarrow{MoO} HCHO + H_{2}O$ $C_{2}H_{6} + O_{2} \xrightarrow{MoO} CH_{3}CHO + H_{2}O$

4. Slow combustion

 $CH_4 \xrightarrow{[0]}{K_2Cr_2O_7} CH_3OH \xrightarrow{[0]}{K_2Cr_2O_7} HCHO \xrightarrow{[0]}{K_2Cr_2O_7} HCOOH$

Alkenes

- Alkenes are unsaturated aliphatic hydrocarbons containing a carbon-carbon double bond.
- They are also called olefins because of their tendency to form oily products.
- The general formula of alkenes is C_nH_{2n}.

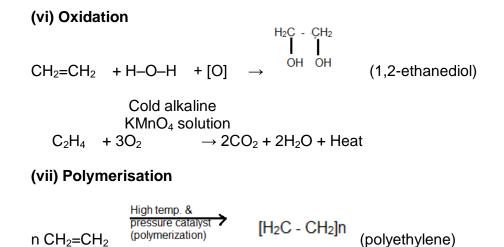

Structure of Ethene

H.C.C Electronic structure

 $H_{H} = C = C_{H}$ Structural formula (C₂H₄)

- Two carbon atoms linked by a double covalent bond.
- A double covalent bond is formed by sharing of two pairs of electrons between the two carbon atoms.
- Four C–H single covalent bonds and one C=C double covalent bond.
- It is a planar molecule and all bond angles (H–C–H and H–C=C) are of 120°.

Preparation of Ethene i. Dehydration of ethyl alcohol HH $\begin{array}{c} H - \stackrel{1}{C} - \stackrel{1}{C} - H \\ H O H \end{array} \xrightarrow{\text{Conc. H}_2\text{SO}_4} \rightarrow \end{array}$ $CH_2 = CH_2 + H_2O$ ii. Dehydrohalogenation of ethyl bromide $\begin{array}{c} H H \\ H - C - C - H \\ H Br \\ H Br \\ \end{array} + KOH$ Boil $\stackrel{\text{II}}{\longrightarrow} CH_2 = CH_2 + KBr + H_2O$ (alcoholic) iii. Cracking of methane $CH_3-CH_3 \xrightarrow{500^{\circ}C} CH_2=CH_2 + H_2$ **Chemical properties** 1. Addition Reactions (i) Catalytic hydrogenation $CH_2=CH_2 + H_2 \xrightarrow{Nickel} C_2H_6$ (ii) Halogenation $CH_2=CH_2 + CI_2$ (iii) Reaction with Halogen Acids H = H = H = HH = H = HH Br $CH_2=CH_2 + HBr \rightarrow$ (bromoethane) (iv) Reaction with Sulphuric acid $CH_2=CH_2 + H. HSO_4 \rightarrow H HSO_4$ (ethyl hydrogen sulphate) (v) Ozone $CH_2=CH_2 + O_3 \xrightarrow{Ether} 0 \xrightarrow{H_2C - 0 - -CH_2} 0 \xrightarrow{H_2C - 0} 0$ (ethylene ozonide)

Alkynes

- Alkynes are unsaturated aliphatic hydrocarbons containing a carbon–carbon triple bond in their molecule.
- The general formula of alkynes is C_nH_{2n-2}.
- They are more reactive than alkenes because of the presence of a triple bond, often referred to as an acetylenic linkage.

Structural formula of Ethyne

 $H - C \equiv C - H$ tructural formula (CH₂=CH₂)

CH

Preparation of Ethyne

i. Laboratory preparation from calcium carbide

$$\overset{C}{\leftarrow} \overset{C}{+} \overset{C}$$

ii. From 1,2-dibromoethane

 $\begin{array}{c} CH_2 & -- & CH_2 \\ I & I \\ Br & Br & + 2KOH \end{array} \xrightarrow{Boil} \begin{array}{c} CH \\ \hline & CH \\ \hline & CH \end{array} + 2KBr + 2H_2O \end{array}$

iii.From methane

 $2CH_4 \xrightarrow{1500^{\circ}C} \cdot CH + 3H_2$

Chemical Properties

- 1. Addition Reactions
 - a] Catalytic Hydrogenation

b] Halogenation

c] Reaction with Halogen Acids

$$H - C = C - H$$

$$H - C = C -$$

d] Ozone

$$\begin{array}{c} \begin{array}{c} CH \\ \hline \\ CH \end{array} + O_3 \end{array} \rightarrow \begin{array}{c} H - \begin{array}{c} C \\ C \end{array} - \begin{array}{c} C \\ - \end{array} \\ O \end{array} \\ \end{array} \begin{array}{c} O \\ - \end{array} \end{array} (acetylene ozonide)$$

e] Oxidation of ethyne (Combustion)

CH

$$2 \cdot CH$$
 + 5O₂ \rightarrow 4CO₂ + 2H₂O + Heat

Alcohols

- Alcohols are hydroxyl derivatives of alkanes obtained by replacement of one, two or three hydrogen atoms of alkanes by the corresponding number of –OH groups.
- The hydroxyl group is the functional group of alcohols.
- The general molecular formula of alcohols is C_nH_{2n+1} OH.

Preparation of Ethanol

(i) Laboratory preparation by hydrolysis of alkyl halides

 $C_2H_5CI + NaOH_{(aq)} \rightarrow C_2H_5OH + NaCI$

(ii) Industrial Method

(a) Hydration of Ethene

$$C_2H_4 + H_2SO_4 \xrightarrow{80^{\circ}C} C_2H_5HSO_4$$

 $C_2H_5HSO_4 + H_2O \rightarrow C_2H_5OH + H_2SO_4$

(b) Fermentation of Carbohydrates

 $C_{12}H_{22}O_{11} + H_2O$ Zymase $C_6H_{12}O_6 + C_6H_{12}O_6 + C_6H_{12}O_6$ $C_6H_{12}O_6 + C_6H_{12}O_6$

Chemical properties

1. Combustion

 $C_2H_5OH+3O_2\rightarrow 2CO_2+3H_2O$

- 2. Oxidation with $K_2Cr_2O_7$ $\downarrow 0 \\ C_2H_5OH \xrightarrow{[O]}{K_2Cr_2O_7} CH_3CHO \xrightarrow{[O]}{K_2Cr_2O_7} CH_3COOH (acetic acid)$
- 3. Reaction with Sodium $2C_2H_5OH + 2Na \rightarrow 2C_2H_5ONa + H_2$
- 4. Reaction with Acetic acid C₂H₅OH + CH₃COOH \rightarrow CH₃COOC₂H₅ + H₂O
- 5. Reaction with Sulphuric acid

 $C_{2}H_{5}OH \xrightarrow{Conc.H_{2}SO_{4}} CH_{2}=CH_{2} + H_{2}O$ $C_{2}H_{5}OH \xrightarrow{Conc.H_{2}SO_{4}} CH_{2}=CH_{2} + H_{2}O$

6. Reaction with PCI₃ $3C_2H_5OH + PCI_3 \rightarrow 3C_2H_5CI + H_3PO_3$

Carboxylic Acids

- Carboxylic acids are organic compounds containing a carboxylic group (–COOH) attached to an alkyl group or to a hydrogen atom.
- Representation of carboxylic acids: R-COOH (R is either -H or alkyl)
- The functional group of carboxylic acids: -COOH (carboxylic)
- The acidic character in carboxylic acids is because of the presence of the replaceable hydrogen atom in the carboxylic group.

Preparation of Acetic Acid A] By oxidation of ethyl alcohol

 $C_{2}H_{5}OH + [O] \xrightarrow{K_{2}Cr_{2}O_{7}} CH_{3}CHO + [O] \xrightarrow{K_{2}Cr_{2}O_{7}} CH_{3}CHO + [O]$

B] By hydrolysis of ethyl acetate

 $CH_{3}COOC_{2}H_{5} + H_{2}O \xrightarrow{Hydrolysis} CH_{3}COOH + C_{2}H_{5}OH$

Chemical Properties

1. It is a weak acid and turns blue litmus red.

2. Reaction with Alkalis

 $\label{eq:constraint} \begin{array}{l} \mathsf{CH}_3\mathsf{COOH} + \mathsf{NaOH} \rightarrow \mathsf{CH}_3\mathsf{COONa} + \mathsf{H}_2\mathsf{O} \\ \mathsf{CH}_3\mathsf{COOH} + \mathsf{NH}_4\mathsf{OH} \rightarrow \mathsf{CH}_3\mathsf{COONH}_4 + \mathsf{H}_2\mathsf{O} \end{array}$

3. Reaction with Carbonates

 $\begin{array}{l} 2\mathsf{CH}_3\mathsf{COOH} + \mathsf{Na}_2\mathsf{CO}_3 \rightarrow 2\mathsf{CH}_3\mathsf{COONa} + \mathsf{H}_2\mathsf{O} + \mathsf{CO}_2\\ \mathsf{CH}_3\mathsf{COOH} + \mathsf{Na}\mathsf{HCO}_3 \rightarrow \mathsf{CH}_3\mathsf{COONa} + \mathsf{H}_2\mathsf{O} + \mathsf{CO}_2 \end{array}$

4. Reaction with Alcohols

 $CH_{3}COOH + C_{2}H_{5}OH \xrightarrow{H_{2}SO_{4}} CH_{3}COOC_{2}H_{5} + H_{2}O$

5. Reaction with PCI₃ CH₃COOH + PCI₅ \rightarrow CH₃COCI + POCI₃ + HCI

6. Reduction CH₃COOH + 4[H] \rightarrow C₂H₅OH + H₂O
